

**Amendments to the claims:**

This listing of the claims will replace all prior versions and listings of the claims in the application:

**Listing of the Claims:**

1. (currently amended) A method of receiving digital data at a wireless terminal, the method comprising:

designating at the wireless terminal acceptable sources from which received digital data will be processed;

receiving a packet of digital data at the wireless terminal;

determining if the packet of digital data is from an acceptable source designated at the wireless terminal;

if the packet of digital data is from an acceptable source, processing the packet of digital data; and

if the packet of digital data is not from an acceptable source, blocking the packet of digital data from processing;

accepting user input of blocking mode enable and blocking mode disable commands;  
in response to a blocking mode enable command, processing the packet of digital data only if information in the packet of digital data is required to maintain a communications link, and blocking processing of the packet of digital data if information in the packet of digital data is not required to maintain a communications link even when the packet of digital data is from an acceptable source; and

in response to a blocking mode disable command, processing the packet of digital data if the received packet of digital data is from an acceptable source

2. (original) A method according to Claim 1 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises accepting user input of the acceptable sources.

3. (original) A method according to Claim 1 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one class of sources from which packets of digital data will be processed.

4. (original) A method according to Claim 1 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one specific source from which packets of digital data will be processed.

Claim 5 (canceled).

6. (currently amended) A method according to ~~Claim 5~~ Claim 1 wherein information required to maintain a communications link comprises synchronization information.

7. (currently amended) A method according to ~~Claim 5~~ Claim 1 further comprising: processing radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

8. (original) A method according to Claim 1 further comprising:  
accepting user input of external request mode enable and external request mode disable commands;  
in response to an external request mode enable command, executing external requests for data transfer at the wireless terminal; and  
in response to an external request mode disable command, disregarding external requests for data transfer at the wireless terminal.

9. (original) A method according to Claim 8 further comprising:  
executing user initiated tasks when the external request mode is enabled and when the external request mode is disabled.

10. (original) A method according to Claim 8 further comprising:  
receiving radiotelephone pages when the external request mode is enabled and when the external request mode is disabled.

11. (currently amended) A method of transmitting digital data from a wireless service provider to a wireless terminal, the method comprising:  
designating at the wireless service provider acceptable sources from which packets of digital data will be transmitted to the wireless terminal;  
providing a packet of digital data at the wireless service provider to be transmitted to the wireless terminal;  
determining if the packet of digital data is from an acceptable source;  
if the packet of digital data is from an acceptable source, transmitting the packet of digital data to the wireless terminal; and  
if the packet of digital data is not from an acceptable source, blocking the packet of digital data from transmission to the wireless terminal;  
accepting blocking mode enable and blocking mode disable commands for the wireless terminal;  
in response to a blocking mode enable command, transmitting the packet of digital data only if information in the packet of digital data is required to maintain a communications link, and blocking transmitting of the packet of digital data if information in the packet of digital data is not required to maintain a communications link even when the packet of digital data is from an acceptable source; and  
in response to a blocking mode disable command, transmitting the packet of digital data if the packet of digital data is from an acceptable source.

12. (original) A method according to Claim 11 wherein designating at the wireless service provider acceptable sources from which packets of digital data will be transmitted to the wireless terminal comprises receiving the acceptable sources from the wireless terminal.

13. (original) A method according to Claim 11 wherein designating at the wireless service provider acceptable sources from which packets of digital data will be transmitted to the wireless terminal comprises designating at least one class of sources from which packets of digital data will be transmitted to the wireless terminal.

14. (original) A method according to Claim 11 wherein designating at the wireless service provider acceptable sources from which packets of digital data will be transmitted to the wireless terminal comprises designating at least one specific source from which packets of digital data will be transmitted to the wireless terminal.

Claim 15 (canceled).

16. (currently amended) A method according to ~~Claim 15~~ Claim 11 wherein information required to maintain a communications link comprises synchronization information.

17. (currently amended) A method according to ~~Claim 15~~ Claim 11 further comprising:  
transmitting radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled for the wireless terminal.

18. (original) A method according to Claim 11 further comprising:  
accepting external request mode enable and external request mode disable commands for the wireless terminal;  
in response to an external request mode enable command, transmitting external requests for data transfer to the wireless terminal; and  
in response to an external request mode disable command, disregarding external requests for data transfer for the wireless terminal.

19. (original) A method according to Claim 18 further comprising:  
transmitting radiotelephone pages to the wireless terminal when the external request mode is enabled and when the external request mode is disabled.

Claims 20-27 (canceled).

28. (original) A method of receiving digital data at a wireless terminal, the method comprising:  
accepting user input of a blocking mode enable and blocking mode disable commands;  
receiving a packet of digital data at the wireless terminal;  
in response to a blocking mode enable command, processing the packet of digital data only if information in the packet of digital data is required to maintain a communications link, and blocking processing of the packet of digital data if information in the packet of digital data is not required to maintain a communications link; and  
in response to a blocking mode disable command, processing the packet of digital data if information in the packet of digital data is required to maintain a communications link or if information in the packet of digital data is desired at the wireless terminal.

29. (original) A method according to Claim 28 wherein information required to maintain a communications link comprises synchronization information.

30. (original) A method according to Claim 28 further comprising:  
processing radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

31. (original) A method according to Claim 28 further comprising:  
designating at the wireless terminal acceptable sources from which packets of digital

data will be processed;

determining if the packet of digital data is from an acceptable source designated for the wireless terminal;

if the packet of digital data is from an acceptable source and the blocking mode is disabled, processing the packet of digital data; and

if the received packet of digital data is not from an acceptable source, blocking processing of the packet of digital data even when the blocking mode is disabled.

32. (original) A method according to Claim 31 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises accepting user input of the acceptable sources.

33. (original) A method according to Claim 31 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one class of sources from which packets of digital data will be processed.

34. (original) A method according to Claim 31 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one specific source from which packets of digital data will be processed.

35. (original) A method according to Claim 28 further comprising:  
accepting user input of external request mode enable and external request mode disable commands;  
in response to an external request mode enable command, executing external requests for data transfer at the wireless terminal; and  
in response to an external request mode disable command, disregarding external requests for data transfer at the wireless terminal.

36. (original) A method according to Claim 35 further comprising:

executing user initiated tasks when the external request mode is enabled and when the external request mode is disabled.

37. (original) A method according to Claim 35 further comprising:  
processing radiotelephone pages when the external request mode is enabled and when the external request mode is disabled.

38. (original) A method of transmitting digital data from a wireless service provider to a wireless terminal, the method comprising:

accepting blocking mode enable and blocking mode disable commands from the user terminal;

providing a packet of digital data at the wireless service provider;

in response to a blocking mode enable command, transmitting the packet of digital data only if information in the packet of digital data is required to maintain a communications link between the wireless service provider and the wireless terminal, and blocking transmitting of the packet of digital data if information in the packet of digital data is not required to maintain a communications link; and

in response to a blocking mode disable command, transmitting the packet of digital data if information in the packet of digital data is required to maintain a communications link or if information in the packet of digital data is desired at the wireless terminal.

39. (original) A method according to Claim 38 wherein information required to maintain a communications link comprises synchronization information.

40. (original) A method according to Claim 38 further comprising:  
transmitting radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

41. (original) A method according to Claim 38 further comprising:

designating at the wireless service provider acceptable sources from which received digital data will be processed at the wireless terminal;

determining if the packet of digital data is from an acceptable source for the wireless terminal;

if the packet of digital data is from an acceptable source and the blocking mode is disabled, transmitting the packet of digital data to the wireless terminal; and

if the packet of digital data is not from an acceptable source, blocking transmitting of the packet of digital data even when the blocking mode is disabled.

42. (original) A method according to Claim 41 wherein designating at the wireless service provider acceptable sources from which packets of digital data will be processed comprises accepting the acceptable sources from the wireless terminal.

43. (original) A method according to Claim 41 wherein designating at the wireless service provider acceptable sources comprises designating at least one class of sources from which packets of digital data will be transmitted to the wireless terminal.

44. (original) A method according to Claim 41 wherein designating at the wireless service provider acceptable sources comprises designating at least one specific source from which received digital data will be transmitted to the wireless terminal.

45. (original) A method according to Claim 38 further comprising:  
accepting external request mode enable and external request mode disable commands for the wireless terminal;

in response to an external request mode enable command, transmitting external requests for data transfer for the wireless terminal; and

in response to an external request mode disable command, disregarding external requests for data transfer for the wireless terminal.

46. (original) A method according to Claim 45 further comprising:  
transmitting radiotelephone pages to the wireless terminal when the external request mode is enabled and when the external request mode is disabled for the wireless terminal.

47. (original) A wireless terminal for communicating digital data with a wireless communications system, the wireless terminal comprising:  
a user interface that accepts user input of a blocking mode enable and blocking mode disable commands;  
a receiver that receives a packet of digital data; and  
a controller that processes the packet of digital data in response to a blocking mode enable command only if information in the packet of digital data is required to maintain a communications link, and that blocks processing of the packet of digital data if information in the packet of digital data is not required to maintain a communications link, and wherein the controller processes the packet of digital data in response to a blocking mode disable command if information in the packet of digital data is required to maintain a communications link or if information in the packet of digital data is desired at the wireless terminal.

48. (original) A wireless terminal according to Claim 47 wherein information required to maintain a communications link comprises synchronization information.

49. (original) A wireless terminal according to Claim 47 wherein the controller processes radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

50. (original) A wireless communications system for communicating digital data with a wireless terminal, the wireless communications system comprising:  
a controller responsive to blocking mode enable and blocking mode disable commands from the wireless terminal wherein the controller provides a packet of digital data

at the wireless service provider, wherein the controller allows transmission of the packet of digital data in response to a blocking mode enable command only if information in the packet of digital data is required to maintain a communications link between the wireless communications system and the wireless terminal, wherein the controller blocks transmitting of the packet of digital data in response to a blocking mode enable command if information in the packet of digital data is not required to maintain a communications link, and wherein the controller allows transmission of the packet of digital data in response to a blocking mode disable command if information in the packet of digital data is required to maintain a communications link or if information in the packet of digital data is desired at the wireless terminal.

51. (original) A wireless communications system according to Claim 50 wherein information required to maintain a communications link comprises synchronization information.

52. (original) A wireless communications system according to Claim 50 further comprising:

a transmitter that transmits radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

53. (currently amended) A method of receiving digital data at a wireless terminal, the method comprising:

accepting user input of external request mode enable and external request mode disable commands;

in response to an external request mode enable command, executing external requests for data transfer at the wireless terminal; ~~and~~

in response to an external request mode disable command, disregarding external requests for data transfer at the wireless terminal.

accepting user input of a blocking mode enable and blocking mode disable

commands;

receiving a packet of digital data at the wireless terminal;

in response to a blocking mode enable command, processing the packet of digital data only if information in the packet of digital data is required to maintain a communications link, and blocking processing of the packet of digital data if information in the packet of digital data is not required to maintain a communications link; and

in response to a blocking mode disable command, processing the packet of digital data if information in the packet of digital data is required to maintain a communications link or if information in the packet of digital data is desired at the wireless terminal.

54. (original) A method according to Claim 53 further comprising:  
executing user initiated tasks when the external request mode is enabled and when the external request mode is disabled.

55. (original) A method according to Claim 53 further comprising:  
processing radiotelephone pages when the external request mode is enabled and when the external request mode is disabled.

56. (original) A method according to Claim 53 further comprising:  
designating at the wireless terminal acceptable sources from which received digital data will be processed;  
receiving a packet of digital data at the wireless terminal;  
determining if the packet of digital data is from an acceptable source designated at the wireless terminal;  
if the packet of digital data is from an acceptable source, processing the packet of digital data; and  
if the packet of digital data is not from an acceptable source, blocking the packet of digital data from processing.

57. (original) A method according to Claim 56 wherein designating at the wireless terminal acceptable sources from packets of digital data will be processed comprises accepting user input of the acceptable sources.

58. (original) A method according to Claim 56 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one class of sources from which packets of digital data will be processed.

59. (original) A method according to Claim 56 wherein designating at the wireless terminal acceptable sources from which packets of digital data will be processed comprises designating at least one specific source from which packets of digital data will be processed.

Claim 60 (canceled).

61. (currently amended) A method according to ~~Claim 60~~ Claim 53 wherein information required to maintain a communications link comprises synchronization information.

62. (currently amended) A method according to ~~Claim 60~~ Claim 53 further comprising:

processing radiotelephone pages when the blocking mode is enabled and when the blocking mode is disabled.

63. (currently amended) A method of transmitting digital data from a wireless service provider to a wireless terminal, the method comprising:

accepting external request mode enable and external request mode disable commands for the wireless terminal;

in response to an external request mode enable command for the wireless terminal, transmitting external requests for data transfer to the wireless terminal; and

in response to an external request mode disable command for the wireless terminal,  
disregarding external requests for data transfer at the wireless terminal.

accepting blocking mode enable and blocking mode disable commands for the  
wireless terminal;

receiving a packet of digital data for the wireless terminal;

in response to a blocking mode enable command for the wireless terminal,  
transmitting the packet of digital data only if information in the packet of digital data is  
required to maintain a communications link, and blocking transmitting of the packet of digital  
data if information in the packet of digital data is not required to maintain a communications  
link; and

in response to a blocking mode disable command for the wireless terminal,  
transmitting the packet of digital data if information in the packet of digital data is required to  
maintain a communications link or if information in the packet of digital data is desired at the  
wireless terminal

64. (original) A method according to Claim 63 further comprising:  
supporting tasks initiated at the wireless terminal when the external request mode is  
enabled and when the external request mode is disabled.

65. (original) A method according to Claim 63 further comprising:  
transmitting radiotelephone pages to the wireless terminal when the external request  
mode is enabled for the wireless terminal and when the external request mode is disabled for  
the wireless terminal.

66. (original) A method according to Claim 63 further comprising:  
designating at the wireless service provider acceptable sources from which packets of  
digital data will be processed for the wireless terminal;  
providing a packet of digital data for the wireless terminal;  
determining if the packet of digital data is from an acceptable source designated for

the wireless terminal;

if the packet of digital data is from an acceptable source, transmitting the packet of digital data; and

if the packet of digital data is not from an acceptable source, blocking transmitting of the packet of digital data.

67. (original) A method according to Claim 66 wherein designating at the wireless service provider acceptable sources from which digital data will be processed at the wireless terminal comprises receiving the acceptable sources from the wireless terminal.

68. (original) A method according to Claim 66 wherein designating at the wireless service provider acceptable sources from which received digital data will be processed at the wireless terminal comprises designating at least one class of sources from which received digital data will be processed at the wireless terminal.

69. (original) A method according to Claim 66 wherein designating at the wireless service provider acceptable sources from which digital data will be processed at the wireless terminal comprises designating at least one specific source from which digital data will be processed at the wireless terminal.

Claim 70 (canceled).

71. (currently amended) A method according to ~~Claim 70~~ Claim 63 wherein information required to maintain a communications link comprises synchronization information.

72. (currently amended) A method according to ~~Claim 70~~ Claim 63 further comprising:

transmitting radiotelephone pages to the wireless terminal when the blocking mode is

enabled and when the blocking mode is disabled for the wireless terminal.

Claims 73-77 (canceled).
